### **Who is 16 and who is 17?**

In this quiz we are going to ask our classmates to take a survey so we can know who in our classroom is 16 years old or less and who is 17.

We used controls like "if", to help conditionate the variable. We used the program pseint to help program our survey.

It asks three questions

- How many people will participate?
- Write your name and last name
- Write your age

When you write your answer, the program is informed to read the variable. In the case of age, when you write your age the program identifies if it is older than 16 or younger, and it adds a point to the one that corresponds.

At the end it shows the results, and you can identify which is the one with more points.
